

Ideal for regenerative medicine, stem cell therapy, IVF, routine cell culture, microbiology and animal research applications.

Designed with Purpose

PHCbi brand CO_2 and multigas CO_2/O_2 incubators represent generations of successful product development in response to emerging cell culture protocols used around the world. Our incubators use innovative technology to fulfill a wide range of applications, from the most sophisticated, finely tuned and externally regulated processes in clinical medicine, to the widespread need for cell culture in mammalian investigations in academic, biotechnology, pharmaceutical and agricultural laboratories.

^{*} FDA registered as a Class 2 Assisted Reproduction Device.

For more than 50 years PHC Corporation has maintained a reputation for worldwide leadership in the design and manufacture of cell culture incubators and associated laboratory equipment used in biopharmaceutical, life sciences, academic, healthcare and government markets.

High heat decontamination at 180°C extends product selection

PHCbi brand incubators are engineered to assure stability and accuracy required for reproducible results in the laboratory, from one day to the next, from one protocol to another.

Our product line offers the choices you need for gas control, single or multiple gas systems and decontamination methods to suit your preference. Standard cabinet sizes are configured for new and replacement installation with minimal site preparation.

Reproducibility and the Fundamentals of Critical Parameters

Reproducibility

PHCbi brand incubators include a suite of complementary operating systems designed to work together to achieve the highest level of reproducibility possible. Each incubator model uses a combination of essential technologies which share performance functions across the design platform. PHCbi brand incubators are designed to minimize uncertainty by providing stable, uniform and accurate conditions from one day to the next.

- Contamination Control
- Decontamination
- Automatic Gas Control
- Heat
- Humidification

Fundamentals

The primary purpose of a cell culture incubator is to provide accurate, repeatable and flexible environments essential to replication of the *in vivo* condition *in vitro*. Once the physiology of a specific *in vivo* condition is known, the investigator can create an ex vivo model inside the incubator chamber by managing a balance of temperature, CO_2 , (and O_2 selected models) in a humidified atmosphere which prevents media desiccation.

The Cell-IQ and CytoGrow product groups represent a continuing evolution in incubator development to meet emerging demands of scientific and medical research.

Innovated designs, advancements in high performance sensors, contamination control methods, energy-efficient cabinet construction and creative material applications have earned PHCbi brand products a best-in-class reputation for clinical and research uses where reproducibility is critical.

CO₂ and CO₂/O₂ Incubators

^{*}FDA registered as a Class 2 Assisted Reproduction Device, FDA Product Code MQG, approved for in vitro fertilization applications, Registration Number 9616263.

Active Background Contamination Control

The concept of Active Background Contamination Control was introduced by PHC Corporation as early as 2001. This approach to maintaining a safe interior environment is based on passive design attributes inherent to cabinet materials and systems, as well as user-initiated or programmed active control sequences that can be turned on when desired.

The primary components of this technique are found in copper enriched stainless steel interior protection and destruction of airborne contaminants by UV light exposure within the positive airflow plenum. Both work continuously to inhibit the growth of organisms on interior surfaces of walls and shelves, and by destroying the DNA of pathogens that enter the chamber through door openings or normal handling.

Serial dilution of the closed chamber atmosphere assures that all airborne organisms will be exposed to UV light within the gentle airflow.

All incubators are designed for easy removal of interior components, if a manual wipe down of interior surfaces using 70% ethanol is desired. This 70% solution is diluted to slow evaporation and provide time for the ethanol to be effective.

The interior airflow plenum gently directs air past the integral UV lamp before passing over the humidity pan. Any surface contaminants in the water are destroyed by UV exposure. The entire system is completely isolated from the active incubator chamber. When required, all components remove easily without tools.

Active Background

Contamination Control

InCu-saFe Germicidal Protection

Copper enriched stainless steel is a hybrid Type 304 composite material that provides contact destruction of organisms while preventing growth of pathogens on interior surfaces.

- Unlike conventional C100 copper interior designs, the inCu-saFe material does not discolor or corrode over time.
- All walls, floors, ceilings, shelves and other structural components in the chamber are fabricated from inCu-saFe material.
- InCu-saFe is standard on all Cell-IQ and CytoGrow incubators.

DECONTAMINATION

SafeCell UV

Patented SafeCell UV technology uses a programmable ultraviolet lamp to inhibit the growth of mycoplasma, bacteria, molds, spores, viruses, yeasts and fungi in the chamber atmosphere. Costly HEPA filter air scrubbers that simply trap contaminants are not required.

- Located away from active cell cultures and out of view, the SafeCell UV lamp operates on an automatic cycle that starts whenever an incubator is accessed. Once the door is closed, the circulation fan resumes a gentle serial airflow throughout the chamber, eventually passing all air over the humidity reservoir in the chamber base where UV light emitting a 253.7 nm wavelength kills airborne contaminants on the water surface without creating ozone. The timing of this passive sequence is adjustable from 0 to 30 minutes. The factory default setting is 10 minutes after each door opening.
- If an overnight decontamination process is desired, all interior components can be removed for autoclaving while the UV light is manually programmed for a timed 100% ON cycle extending for up to several hours. With interior components removed all remaining surfaces are exposed to the UV light where contaminants are destroyed.

A UV lamp hour counter automatically records ON time for all cycles and adjusts intensity to compensate for lamp life. The controller notifies the user when it is time to replace the lamp. Replacement is completed quickly and without tools. The useful life of the UV lamp is estimated in years, depending on frequency of use.

The SafeCell UV lamp is a highly effective, ozone-free contamination control technique

Active Background Contamination Control	~

The SafeCell UV system is effective in destroying a broad range of bacteria, molds, yeasts, protozoa and viruses. Efficacy is based on incident energy at 253.7 nm necessary to inhibit colony formation in greater than 99.9% of tested microorganisms, measured in microwatt seconds/cm²

A representation is listed here. For a detailed listing contact PHC Corporation of North America.

✓ Available Option

Decontamination methods are selected based on user preference, and are often ordained by approved GMP or other protocols that mandate continuity of process.

H₂O₂ Vapor Decontamination

Hydrogen peroxide vapor decontamination (H_2O_2) is standard on the Model MCO-170AICUVHL-PA, and optional on Models MCO-50M-PA, MCO-50AICL-PA, MCO-170AICUVL-PA, MCO-170MP-PA and MCO-230AICUVL-PA.

- H₂O₂ is a safe, effective and environmentally friendly decontamination method that reaches all interior surfaces of the incubator.
- A nebulizer placed inside the chamber converts aqueous H₂O₂ to vapor which remains inside the chamber for approximately 30 minutes.
- Upon completion of the vapor exposure, the H_2O_2 is resolved to <1 ppm as benign water vapor in the presence of the UV light.
- There is no need to remove the integral CO₂ sensor or UV lamp.

High Heat Decontamination

High heat decontamination is a standard operating feature of the Model MCO-170AICUVDL-PA, which offers significant advantages over conventional high heat models.

- The high heat decontamination process elevates interior temperature to 180°C and is often initiated for overnight completion.
- After active cell cultures or other life forms are removed from the incubator, the decontamination sequence is manually initiated and automatically operated. The high heat process uses time and a higher temperature than conventional high heat incubators.
- A secondary heating system is energized to ramp up interior temperature to 180°C where it remains for a two-hour dwell to destroy any pathogens inside.
- Once the dwell is completed, the secondary heater is de-energized and temperature returns to the original setpoint. The entire process takes approximately 12 hours.
- High performance, heat-resistant melamine foam insulation minimizes heat transfer to the exterior cabinet surface, permitting the process to proceed without moving adjacent or stacked incubators or other laboratory equipment.
- There is no need to remove the integral CO₂ sensor or UV lamp.

PHCbi brand cell culture incubators are available in a selection of CO₂ and multigas CO₂/O₂ models. Gas blends are managed by a microprocessor controller which calculates gas percentages based on input from CO₂ or O₂ sensors. Gas setpoints and actual levels are displayed on the main control panel for easy reference.

Automatic CO₂ Control

Cell-IQ incubators use high-performance infrared (IR) detectors to measure CO₂ concentration. CytoGrow incubators use a thermal conductivity sensor or infrared sensor, depending on model; see chart.

Infrared CO₂ Control System

The infrared CO_2 control system is designed for automatic gas control as well as real-time calibration to assure accuracy to setpoint and proper indication on the digital display to within 0.1%.

Sensitivity to CO₂ percentage, combined with gas input pressure regulators, achieves fast recovery following door openings without overshoot beyond setpoint.

The gas controller is based on a single light emitting source designed to split before passing through actual chamber and reference air concentrations where signals are measured by light filters and scored by sophisticated sensors. The infrared beam passes

through with different values. The CO_2 concentration differential between sensors determines the flow of CO_2 to the chamber and provides continuous data to the controller. This process permits constant calibration and minimizes the need for periodic manual calibration which can be initiated whenever required.

Fast CO₂ Recovery After Door Opening

The infrared CO₂ control system is designed to establish, maintain and recover CO₂ concentration to the desired setpoint. This sensor provides accurate control and accuracy with fast recovery to setpoint following door openings. The PID control algorithm eliminates overshoot as CO₂ is restored, typically in less than 2 minutes.

Thermal Conductivity CO₂ Control

Thermal conductivity detects changes in resistance associated with the CO₂ percentage in the chamber air.

- The thermal conductivity method is accurate in a stable environment.
- Baseline references change over time based on temperature and humidity, and periodic calibration is recommended.

Conversion of O₂ Ions to Electrical Current

The O₂ molecules diffuse through the Zirconia layer in the sensor, causing a voltage build-up. The voltage then creates an electrical current flow which is detected by the sensing circuit in the incubator.

Oxygen Control Zirconia

Research into cell culture at below ambient oxygen levels is expanding exponentially as protocols are investigated, tested and published in professional journals. Oxygen levels below ambient are typical of mammalian cells *in vivo* and often range from near anaerobic to slightly below ambient. Normal oxygen is approximately 21% in air. When a 5% CO₂ level is introduced, O₂ levels reduce to 19.95%. Automatic control of both CO₂ and oxygen in the cell culture environment permits the most accurate *in vitro* replication of the *in vivo* physiology which can range from 1% to 18% or to near ambient O₂ levels.

- O₂ molecules diffuse through the zirconia layer in the sensor causing a voltage change. The electrical current flow is detected by the sensor, calculated into percentage and the O₂ or N₂ solenoid is opened or closed on demand. There is no impact on CO₂ percentage during this process.
- Because the initial O₂ setpoint may be hypothetical, the adjustable O₂ setpoint permits setpoint values to within 0.1%.
- If O₂ demand changes as the cell cultures mature, O₂ levels are easily changed to manage reproducibility.
- Nitrogen gas used to reduce the oxygen level in the incubator is controlled by an algorithm that calculates N₂ percentage as a reciprocal of O₂ detected by a zirconia sensor.
- Enriched O₂ levels can be established within the range of 22% to 80% O₂, but must be used with extreme caution and in accordance with local codes.

^{*}FDA registered as a Class 2 Assisted Reproduction Device, FDA Product Code MQG, approved for in vitro fertilization applications, Registration Number 9616263.

Direct Heat, Air

The patented Direct Heat and Air Jacket heating system surrounds the inner walls with a natural convection airflow which converts to radiant wall heat. This method achieves accurate, uniform and highly responsive temperature control within the chamber.

Positive Airflow Heating

The large-volume CytoGrow ReachIn Model MCO-80ICL-PA uses a horizontal laminar airflow to establish uniform conditions throughout the chamber. Positive airflow assures quick temperature, $\rm CO_2$ and humidity recovery after door openings. Horizontal circulation across the solid, reinforced inCu-saFe shelves promotes even distribution at all shelf levels with larger loads.

The patented Direct Heat and Air Jacket heating system distributes proportional energy to the interior chamber through a natural convection air jacket. High density insulation surrounds the chamber to protect against ambient temperature fluctuations while providing close internal temperature control. Three separate heating zones are energized according to demand as interpreted by the microprocessor controller. These zones can be energized together, in pairs or separately depending on where heat is required to assure uniformity and to minimize interior condensation points.

Standard Feature Optional Feature

Humidification

Cell culture environments must create humidified air to prevent desiccation of cell culture media. Most PHCbi brand incubators have removable humidity pans designed to hold clean, distilled water which evaporates naturally. Positive vapor pressure is sufficient to retard media desiccation in microplates with small media volumes.

- The stainless steel humidity pan is manually filled with distilled water. Heat from the incubator chamber floor evaporates the water to elevate humidity.
- Multi-zone heat sources designed to manage interior uniformity also offer flexibility in moderating elevated humidity from lower to higher levels.
- Unlike some larger cell culture incubators that use immersion heaters to supplement the natural

humidification process, there are no heating elements exposed to water and there is no scaling or build-up over time.

Condensation Management

Condensation management used in selected PHCbi brand incubators is designed to remove excess chamber humidity. A condensation probe or "dew stick" made from antibacterial material uses a Peltier technique to

condense moisture if the incubator nears 100% saturated humidity. The condensation drips into the humidity pan.

<sup>Exterior dimensions of main cabinet only, excluding handle and other external projections
Exterior dimensions of cabinet excluding handle, rear stand-off brackets and other external projections.
Consult sales rep for doorway entry instructions, less than 37.2°

Current warranty offered at time of printing and may be subject to change; US and Canada only

Ambient temperature 23°C, setting 37°C, CO, 5%, no load, air temperature measured at incubator center</sup>

Nominal value – Background noise 20 dB(A)
Choose from three or four reinforced shelf configurations. Shelf selection must be specified when ordering 7 MCO-170MP and MCO-230AIC series requires MCO-170HB-PA, MCO-170EL-PW, MCO-170UVS-PW and MCO-HP-PW for H₂O₂ Decontamination

SERVICES

PHC Corporation of North America offers a full line of pre-delivery and on-site calibration and validation services. Validation services range from process/manufacturing audits, quality compliance, risk assessment and software qualification. Advanced technology is integrated with contemporary processes for turnkey solutions using NIST calibrated instrumentation for validation and qualification in accordance with all current GxP Regulations (GMP, GLP, GCP), ISO, FDA 21 CFR Part 11, CAP, AABB, CLIA, USDA, local standards and other regulations. Our calibration services are specially designed to verify quality compliance and ensure display accuracy to manufacturing and regulatory specifications. Procedures and documentation are designed to conform to NIST/ISO requirements. ISO/IEC 17025* calibration is available upon request.

We also offer installation and continued technical services. Visit www.phchd.com/us/biomedical/services to learn more.

*Calibration, as well as IOQ/FAT documentation, are available upon request and quoted separately. ISO/IEC 17025.2005 specifies the general competence to carry out testing and/ or calibration including sampling. It covers testing and calibration preformed using standard methods, non-standard methods and laboratory-developed methods. (Ref: ISO Website, May 2016).

LABALERT MONITORING

A real-time monitoring and notification system will protect your process. LabAlert provides independent, wireless monitoring for a range of equipment. The secure, cloud-based solution offers comprehensive monitoring with customizable dashboards for easy user interface. No software installation is required. Supports FDA 21 CFR Part 11 compliance. LabAlert is scalable to meet corporate enterprise standards for efficacy and safety. It works across multiple units, multiple locations and easily adapts to growing facilities.

ADDITIONAL PRODUCTS Complementary product lines under the PHCbi brand include the space saving and energy efficient VIP® ECO and VIP Series ultra-low temperature freezers, cryogenic and biomedical freezers, pharmacy and high performance refrigerators, programmable heated and refrigerated microbiological incubators and Drosophila/Plant Growth Chambers.

For more information, please call PHC Corporation of North America at 800-858-8442, email info@us.phchd.com or visit http://www.phchd.com/us/biomedical.

PHC Corporation of North America

PHC Corporation of North America is a leader in laboratory equipment for biopharmaceutical, life sciences, academic, healthcare and government markets. The company is operated as a subsidiary of PHC Holdings Corporation, Tokyo, Japan, which is a global healthcare company involved in the three core businesses of Medical Devices, Healthcare IT and Life Sciences. Product lines under the new PHCbi brand include the space saving and energy efficient VIP® ECO, TwinGuard® and VIP Series ultra-low temperature freezers, cryogenic and biomedical freezers, pharmacy and high performance refrigerators, cell culture CO₂ and multigas incubators, programmable heated and refrigerated microbiological incubators and Drosophila/Plant Growth Chambers. For more information, please call PHC Corporation of North America at 800-858-8442, email info@us.phchd.com or visit http://www.phchd.com/us/biomedical.
